

## **What is Email Protection and how do I use this service?**

Easy Internet's Email Protection package can scan your incoming email for viruses and spam before they reach your mailbox. This decreases the likelihood of a harmful message infecting your computer.

If an email containing a virus is detected, the offending infected file is quarantined on Easy Internet's servers and a notification message is sent to you detailing the infection.

Easy Internet offers a free spam filter with variable levels of spam filter protection. By default spam filtering is turned off, but for no extra cost this service can be easily added to your mailbox account. For more information regarding spam filtering and how to setup spam filtering to suite your needs, feel free to contact us.

*Please note that Easy Internet makes no claims or guarantees about the reliability of the virus detection service. Easy Internet strongly recommends you continue to run your own up-to-date antivirus software on your own computer or network.*
